Coding & Solution

This section evaluates the quality and completeness of your implemented code and the overall solution. Your submission should demonstrate working functionality, clean code practices, and alignment with your defined requirements.

Instructions:

1. Ensure your code is well-structured, commented, and follows best practices for your chosen technology stack.
2. The solution should address the core problem statement and implement the key functional requirements.
3. Include all source files, configuration files, and setup instructions needed to run the application.
4. Attach or link to your code repository (e.g., GitHub) in the table below.

Solution Summary

Field	Details
Repository Link / URL	https://github.com/mahanthipeetha/personalized-networking-assistant
Programming Language(s)	Python
Framework(s) Used	FastAPI (Backend REST API), Streamlit (Frontend Multi-tab Interface)
Key Features Implemented	• Zero-shot event theme extraction powered by DistilBERT. • Personalized icebreaker/conversation starter generation via GPT-2. • Real-time fact-checking and context validation integration using the live Wikipedia API. • Local interaction metrics tracking (thumbs up/down) saved dynamically to JSON logs.
Pending / Incomplete Features	None. All core functional requirements have been deployed, verified, and tested successfully.
Setup / Run Instructions	1. Install Dependencies: <code>pip install -r requirements.txt</code> 2. Spin up FastAPI Backend: <code>uvicorn backend.main:app --reload</code> 3. Run Streamlit Frontend: <code>streamlit run frontend/app.py</code>

Code Quality Checklist

S.No	Criteria	Status (Yes / No)
1	Code is modular and organized into functions / classes	Yes
2	Meaningful variable and function names are used	Yes
3	Code includes comments / documentation where necessary	Yes
4	Error handling is implemented for critical operations	Yes
5	The application runs without critical errors	Yes
6	Code is committed to a version control repository	Yes

Additional Notes / Comments:

- Robust try-except structures handle latency or rate-limiting over the external Wikipedia API requests gracefully, failing back to standard models without crashing the thread.
- Metrics persistence utilizes local file I/O operations through synchronized atomic JSON locks to prevent file corruption during quick consecutive inputs.
