Customer Journey Map

Phase of Journey	Stage 1 Event Preparation	Stage 2 AI Assistance Execution	Stage 3 Real-Time Verification & Review
Actions <i>What does the customer do?</i>	Copies a raw description text from an upcoming conference or technical meetup event.	Pastes the text into the dashboard, selects the theme extraction parameters, and requests conversation starters.	Evaluates the generated icebreakers, saves useful ones using interaction buttons, and verifies complex technical terms.
Touchpoint <i>What part of the service do they interact with?</i>	Event text description box and custom theme configuration fields in the UI interface.	Red " Analyze Event " call-to-action button and the " Generate Conversation Starters " tab.	Thumbs-up/down dynamic interaction buttons, real-time Wikipedia result cards, and the Live History sidebar log.
Customer Thought <i>What is the customer thinking?</i>	"I hope this software accurately breaks down this complex engineering jargon into topics I actually know."	"Let's see if these generated conversation starters sound natural and professional or like an obvious machine output."	"This icebreaker is perfect! Let me quickly check the Wikipedia summary to make sure I understand this tool completely."
Customer Feeling <i>What is the customer feeling?</i>	Slightly stressed, anxious about interacting, but optimistic about getting prepared.	Curious, engaged, and eager to see automated custom prompts matching their interests.	Confident, empowered, relieved, and ready to network efficiently at the venue.

Process Ownership <i>Who is in the lead on this?</i>	Mahanthi Peetha (System Architecture & Pipeline Integration Leads)	Srinija Sudabathula & Polagani Likhitha (Model Pipelines & Data Handling Execution)	Pirati Harsha Sri & Madhav Challa (API Integration, UI Component Controls & Testing)
Opportunities <i>How can we improve this stage?</i>	Add a collection of pre-saved popular tech conference descriptions to allow quick one-click trial runs.	Refine prompt engineering constraints inside the generator model to reduce the occurrence of generic syntax loops.	Implement true semantic text overlap logic to match claim queries against Wikipedia headers more intelligently.
